

Western and
Central Pacific
Fisheries
Commission

**SCIENTIFIC COMMITTEE
TWENTIETH REGULAR SESSION**

Manila, Philippines
14 – 21 August 2024

Status of observer data management

**WCPFC-SC20-2024/ST-IP-03
16th July 2024**

Aurélien Panizza, Tiffany Vidal, Peter Williams, Colley Falasi, Eparama Loganimoce and Emmanuel Schreiter

1. Introduction

1. Observer data management encompasses a number of activities that ensure the data collected by observers are made available for the work of the Western and Central Pacific Fisheries Commission (WCPFC) in a form that is both representative and of acceptable quality. The main data management responsibilities include the entry and management of observer data in a standardised database system but include a suite of additional activities described in detail in Williams (2011).
2. The Nineteenth Regular Session of the Commission (27 November–4 December 2022; Anon., 2023) reconfirmed the Commission’s support for ROP data processing with its inclusion in the indicative budget for the period 2023-2025.
3. Staff supported by the WCPFC ROP data management project, based at the WCPFC Secretariat, mainly process data from the national observer programme of the Federated States of Micronesia (FSM). WCPFC members other than Pacific Island countries have also contributed to the ROP database including Australia, China, the European Union, Japan, Korea, New Zealand, Philippines, Chinese Taipei and the USA.
4. The majority of observer data processed by the SPC are ROP-defined purse seine trips¹, which have been designated as the highest priority for processing since 2010. However, the WCPFC requirement for 5% observer coverage in the longline fishery (established in 2012) has resulted in increased submission of observer longline data in recent years and these data are now assigned equal priority for processing as the purse seine observer data. The SPC-OFP also processes non-ROP observer data that are of importance to the scientific work of the WCPFC and so have been included in the description of observer data management and data summaries presented in this paper.
5. SPC-OFP has also been provided with a significant amount of data generated from Electronic Monitoring (EM) initiatives undertaken by several Pacific Island countries in recent years. These data are aligned with the ROP minimum data standards but are considered as a different data source to data collected by human observers, which is consistent with the philosophy of WCPFC Project 93 (FFA, PNAO, SPC and WCPFC Secretariat, 2019). There has also been a recent initiative to produce independent draft minimum EM data field standards in Pacific Island countries (SPC, FFA and PNAO, 2020). A breakdown of data generated from EM initiatives has been included in this paper (Table 8).
6. This paper serves to provide an update on the status of ROP data management at SPC-OFP, covering the following:
7. The SC is encouraged to review the information in this paper and provide suggestions for enhancements for future WCPFC meetings, as required.

¹ CMM 2018-05 paragraph 5

Scope of the Commission ROP

5. *The Commission ROP shall apply to the following categories of fishing vessels authorized to fish in the Convention Area in accordance with the Commission’s Conservation and Management Measures 2004-01:*

- i) *vessels fishing exclusively on the high seas in the Convention Area, and*
- ii) *vessels fishing on the high seas and in waters under the jurisdiction of one or more coastal States and vessels fishing in the waters under the national jurisdiction of two or more coastal States.*

2. Activities over the past twelve months

8. The work related to observer data management achieved over the past twelve months includes:
 - SPC technical staff continued to provide remote technical support to the observer data entry staff based at the offices of the WCPFC Secretariat. Further progress was made in refining the process for transferring WCPFC ROP data to the WCPFC Secretariat.
 - The major developments for the Tufman 2 (Observer component) have now been completed, although there is regular, ongoing maintenance of this system. Enhancements and trials of the Electronic Reporting (ER) system (OLLO) for observers active in the South Pacific albacore longline fishery was one of the features of work for the SPC development team during the past year. OLLO was used at sea in New Caledonia, Tonga, Papua New Guinea, Solomon Islands and French Polynesia during the last twelve months.
9. Due to the stability and robustness achieved by the E-reporting tool OLLO, the SPC technical staff have commenced the development of an electronic debriefing module within Tufman2 for the purpose of handling the data collected through OLLO. This module was released toward the end of 2023 and is now ready for trial. Some programmes such as PGOB are expected to start using this new module later this year.
 - SPC technical staff continued to provide regular support to other countries and regional agencies processing observer data using the Tufman 2 observer component.
10. Remote (and some direct) support continued to be provided to Fiji, RMI and FSM to assist with quality control of data generated from EM systems and assistance on the use of the online web-based Observer database-reporting module (“Tufman Reports”), which summarise EM data and provide comparisons of EM data to other types of data (i.e., logbook, onboard observer and port sampling data).
11. In 2022, several SPC data experts began developing the JSON formatted DCC Longline EM Minimum Data Fields Standard. The development of minimum data standards, including additional data fields and clearly articulated explanations for each data field, is expected to improve the standardization, interpretation, and quality control for EM data submissions. The first draft of the proposed EM Longline Minimum Data Fields Standard was discussed during the DCC 12 (December 2022) and have been reviewed by Fiji. The intent for the EM JSON Standard is to allow EM data to be transmitted efficiently between database systems. SPC OFP developers have also created an EM module in Tufman2 so that the EM countries will be able to view their data. This module will include a data submission portal via an Application Programme Interface (API).
12. Several countries (TW, US, KR, JP) now use the WCPFC ER observer data field standards to prepare and submit their observer data, which significantly reduces the time taken to load the observer data provided by these countries (up to five times faster). Data that are not entered using the Tufman 2 system and do not align to the WCPFC ER observer data field standards are referred to by SPC as “non-standard” observer data; these data require the development of specific data loaders with the subsequent loading process being complicated (requiring manual intervention) and time consuming. There remain some CCMs (for example CN, EU and NZ) that continue to submit their observer data in “non-standard” format and SPC will continue to liaise with these CCMs to explore options for enhancing the formats for their data submissions. As at the time of writing this paper, all the recent observer data submissions have now been loaded. Also noting that some data quality issues required manual intervention and/or referral to the original source of the data and has proved to be time consuming.
13. “Tufman Reports” (SPC-developed reporting tool) continues to be enhanced and used regularly by national observer providers, the WCPFC and FFA Secretariats, and several other CCMs. This system continues to be used by Pacific Island countries in preparation of the WCPFC annual reports Part 1 and Part 2 for submission and will continue to expand and evolve over the coming years to meet the requirements of not only national observer programmes, but also SPC, the WCPFC Secretariat, FFA and the PNAO.
14. The restrictions in the region during 2020, 2021 and 2022 due to the impacts of COVID-19 presented various challenges in observer data collection and data management throughout the region. The decline in purse seine observer data from April 2020 was noticeable and is described in tables and figures included

in this paper. Regional and sub-regional meetings and workshops were usually a good opportunity for national observer programmes to submit their scanned workbooks to SPC saving time where bandwidth is limited in transmitting scanned data. Despite these new challenges, observer data submission and data entry were not delayed and were comparable with previous years.

15. In 2019, SPC technical staff developed a module in Tufman2 to manage the data entry of the debriefing data. Some reports have been made available in the reporting tool “Tufman Reports” but more consultation is required with the member countries to ensure they can access all relevant data.
16. In 2023, SPC received observer transshipment reports covering the period from 2017 to 2023. To effectively manage this data, SPC developed a data entry module within Tufman2. This module was specifically designed for processing and organizing the observer transshipment reports received by SPC during the year.

3. Status of Observer data entry, data provisions and issues

17. Table 1 shows the status of observer data received and entered by SPC as of July 2024. Table 2 provides an indication of the available purse-seine observer data processed by fleet. Table 3 details the coverage of Regional Observer Programme (ROP) longline activity for 2023 as reported by the flag state and according to the metrics proposed at TCC10 and agreed on at WCPFC11. Table 4 shows the coverage of ROP longline activity for 2023, as reported by the flag state. Tables 3 and 4 also provide an indication of the longline ROP data submitted to WCPFC/SPC by year and fleet, with the coverage of the data provided; this allows a comparison to the coverage as reported by the flag state and is used to evaluate compliance in achieving the required ROP longline coverage of 5%. Tables 5 and 6 provide an indication of both ROP and non-ROP (i.e., total observer) data provided to SPC with an estimated total observer data coverage relevant to the scientific work of the WCPFC.
18. Pacific Island observers and programmes generate most of the observer data used by the Commission and Table 7 provides an indication of the extent of data generated in recent years. There has also been a significant amount of data generated from EM (although acknowledging the more recent impacts due to COVID-19), and an attempt to quantify these data has been made in Table 8.
19. As noted in previous versions of this report, the summaries of observer data provisions presented herein continue to be constrained by several factors [see Williams et al. (2017) for the details of each factor], including:
 - Accurate information on the complete number of vessel trips by gear and flag in the WCPFC Convention Area;
 - Accurate information on the actual number of observer trips by observer programme, gear and flag; and
 - Assignment of an ROP trip in the unprocessed data.

3.1 Purse seine

20. Provisions of purse seine observer data from 2012–2020 have been described in previous versions of this paper.
21. Observer data for an estimated 49% (1029 trips out of 2120 trips according to VMS data) of observer purse seine trips conducted during 2023 have been received at SPC at the time of writing this paper. The 2023 observer data received represents 80% of the trips with known observer placements (1284 trips).
22. A total of 82% (816 trips) of the observer data received at SPC for 2023 observer activities have now been entered. SPC employs a strategy of processing the most recent observer data (in this case 2023 data) as highest priority, mainly to ensure CCMs can satisfy their Part 1 and Part 2 reporting obligations (for which compliance applies to the most recent year). This is reflected in the “% of trips received without problems” in CATEGORY 5 of Table 1 whereby the outstanding data entry for 2023 (for example) had a higher priority than the outstanding trips to be entered in earlier years, and therefore a higher proportion in this column. The outstanding trips for earlier years will be entered once the current priority for 2023 data entry has been achieved (i.e., resolving the outstanding issues in trip data already received and working with observer programmes in regard to the submission of trips not yet received). For the 2023 purse seine trips received at SPC, only 3 of the trips have problems awaiting to be resolved, which is, so far, a significant improvement on previous years.
23. The breakdown of processed purse-seine observer data by fleet (Table 2) shows that the coverage of 2023 observer data submitted to SPC is generally high, with respect to observer data with known placements.
24. Figure 1 highlights the continuation in the data entry work done by the SPC team and the data entry staff in the region. This graph represents the number of purse seine trips entered during each month for the years 2022 and 2023, and the colours represent a breakdown of when the processed trips were conducted. The graph highlights (1) the priority given to the more recent trips and (2) the data entry work done to catch up

with the backlog of the previous years. The timely data entry of 2023 and 2022 observer data has meant that data for the most recent calendar year were available for the scientific work required for SC20.

25. As reported in previous years, the ‘problematic’ trip data held at SPC awaiting resolution are mainly due to incomplete or poor-quality scanned data submissions. However, trips conducted in 2022 and received by SPC so far, showed minimal problems.
26. It is important that the observer trip data rejected by the observer programmes still be submitted to ensure all observer trip data are available, and that the problems encountered can be reviewed and referred to in future training, debriefing and data quality control procedures. Information on the trips “with unknown status” will require follow-up with flag state and observer service providers, in the absence of any observer trip reporting obligations. Provision of a list of ALL observer trips conducted by each observer service provider on a regular basis would enhance the summary reports presented in this paper. The lack of provision of ‘observer placement lists’ from some national observer programmes remains a major issue.
27. We also highlight the importance of observer service providers submitting debriefing evaluations/scores to allow the assignment of appropriate data quality indicators to the data. In the future, we plan to work with observer providers to resolve the backlog of observer debriefing data and incorporate debriefing data from the PNA Fisheries Information Management System (FIMS) observer-debriefing component into the regional observer database. We anticipate reporting summaries from the observer debriefing data in future versions of this report.
28. Figure 2 provides an indication of the spatial coverage of the purse seine observer data for 2023, noting that the domestic fisheries of Indonesia, Philippines and Vietnam are not shown (although the Philippines purse seine fleet observer effort in the high seas pocket #1 is shown).

3.2 Longline

29. SC11 directed SPC to present a table of longline ROP coverage which included both the coverage reported by each CCM for their longline fleet and the coverage of that fleet according to data provided to the WCPFC. Tables 3 and 4 have been prepared in response to this recommendation for longline ROP coverage for 2022 and 2023, respectively.
30. Previous versions of these tables included the trips for fleets that are restricted to the home EEZ/adjacent high seas only (which are defined as non-ROP). The 15th WCPFC Scientific Committee (SC15), held in Pohnpei, FSM in August 2019, recommended that future versions of Tables 3 and 4 exclude the non-ROP defined data and only report on ROP longline coverage.
31. Tables 5 and 6 provide a breakdown of all longline observer data (ROP and non-ROP) provided to the WCPFC Science Service Provider for Commission work, covering 2022 and 2023, respectively. These tables use the common longline effort metric (hooks) and indicate that overall coverage was 4.5% and 4.8% (respectively for 2022 and 2023) according to data provisions to date. Due to the impacts of COVID-19, it is unlikely that the longline observer coverage for 2022 will exceed the required 5% once all data are submitted.
32. Figures 3 and 4 provide an indication of the spatial coverage of all longline observer data (ROP and non-ROP) provided for 2022 and 2023, respectively. Spatial coverage of longline observer data has improved in recent years, but as noted, the impacts of COVID-19 in 2022 means that the spatial coverage will be less representative in 2022 than the previous few years (2017-2019).
33. Table 9 provides a breakdown of the transshipment observer data processed at SPC. This data was receiving and processed in 2023 and includes transshipments for the period 2017-2023.

3.3 Contribution of Pacific Island observer programmes

34. Table 7 provides a breakdown of observer data collected by each Pacific Island country (PIC) observer programme for 2022 and 2023. For purse seine, the PIC observer data currently cover 11.4% of the tropical WCPFC fishery (based on total tuna catch estimates for the tropical fishery) for 2022, and 62% for 2023 (acknowledging that the overall coverage for the tropical purse seine fishery 2022 is expected to be only 15%-20%). For longline, the PIC observer data currently covers 1.7% and 1.72% of the fishery, respectively for 2022 and 2023, based on total WCPFC tuna catch estimates.

FIGURES

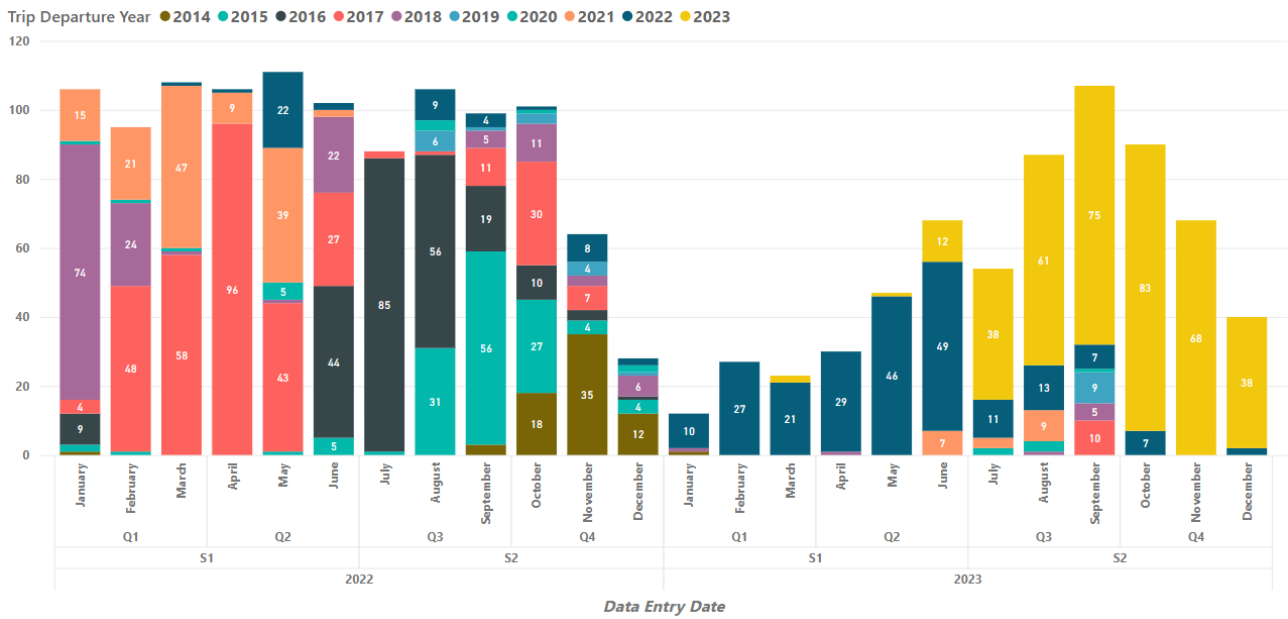

Figure 1. Monthly data entry of purse seine observer data over the past two years. The x-axis represents the year/month when respective observer data were entered into SPC system. The colours represent the departure year for the trips. For example, from January 2023 to December 2023, most of the data entry was from trips conducted in 2022 and 2023.

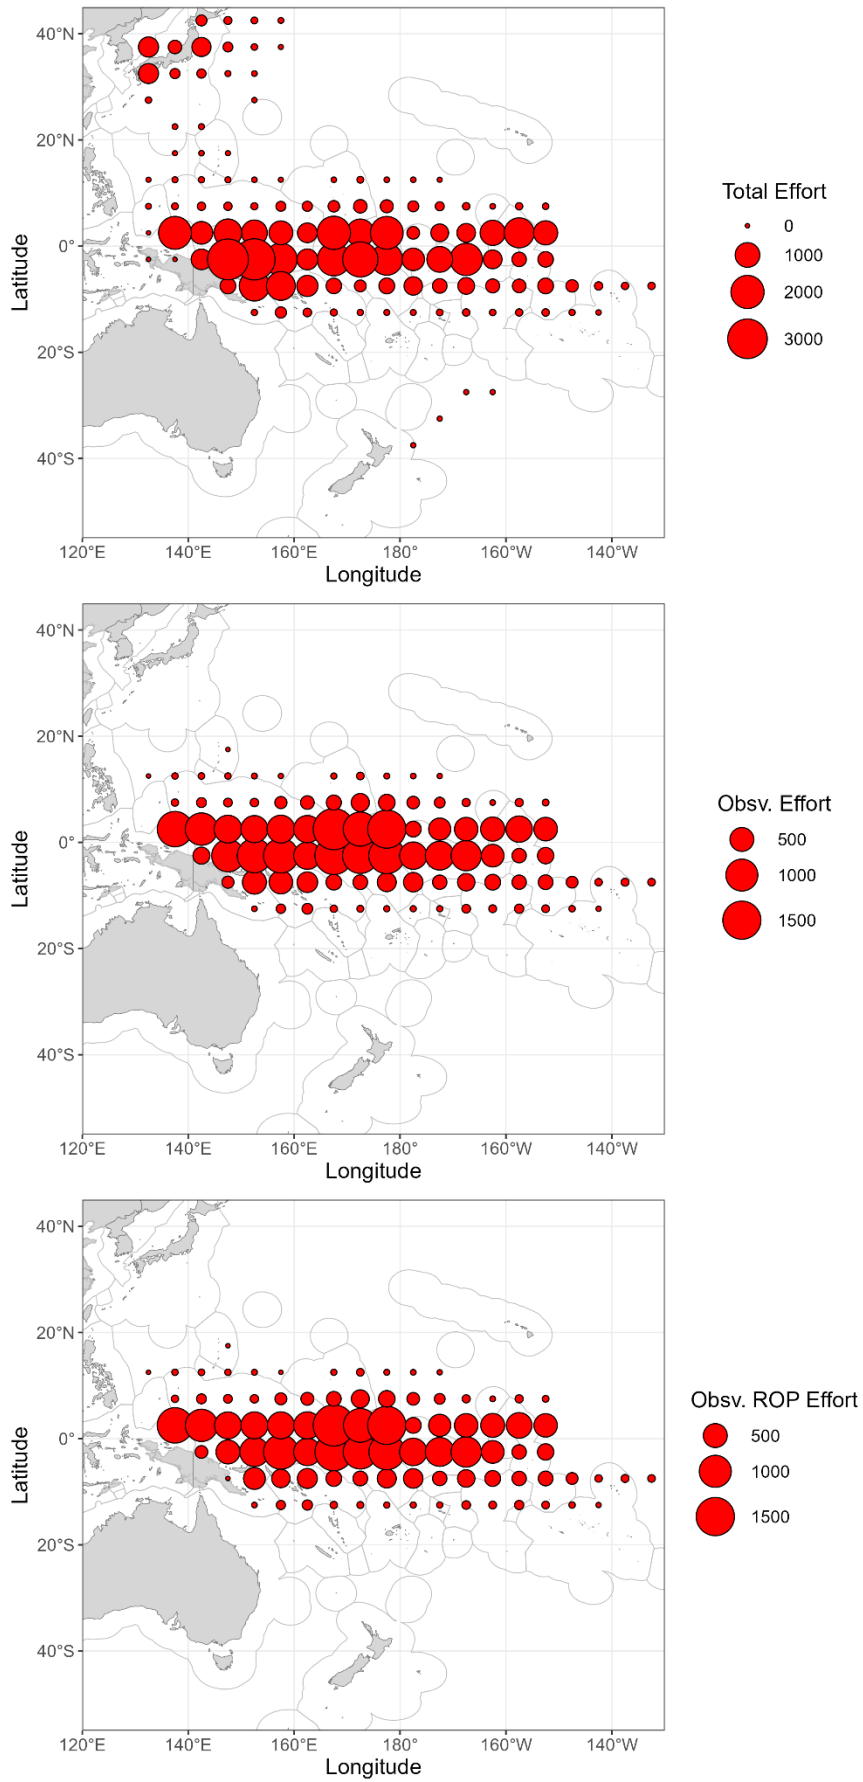

Figure 2. Distribution of purse seine effort (days; top), observed effort (days; middle) and observer ROP effort (days; bottom) in the WCPFC Area for 2023. A day of effort includes fishing and searching. (These data exclude Indonesia, Philippines and Vietnam domestic fisheries)

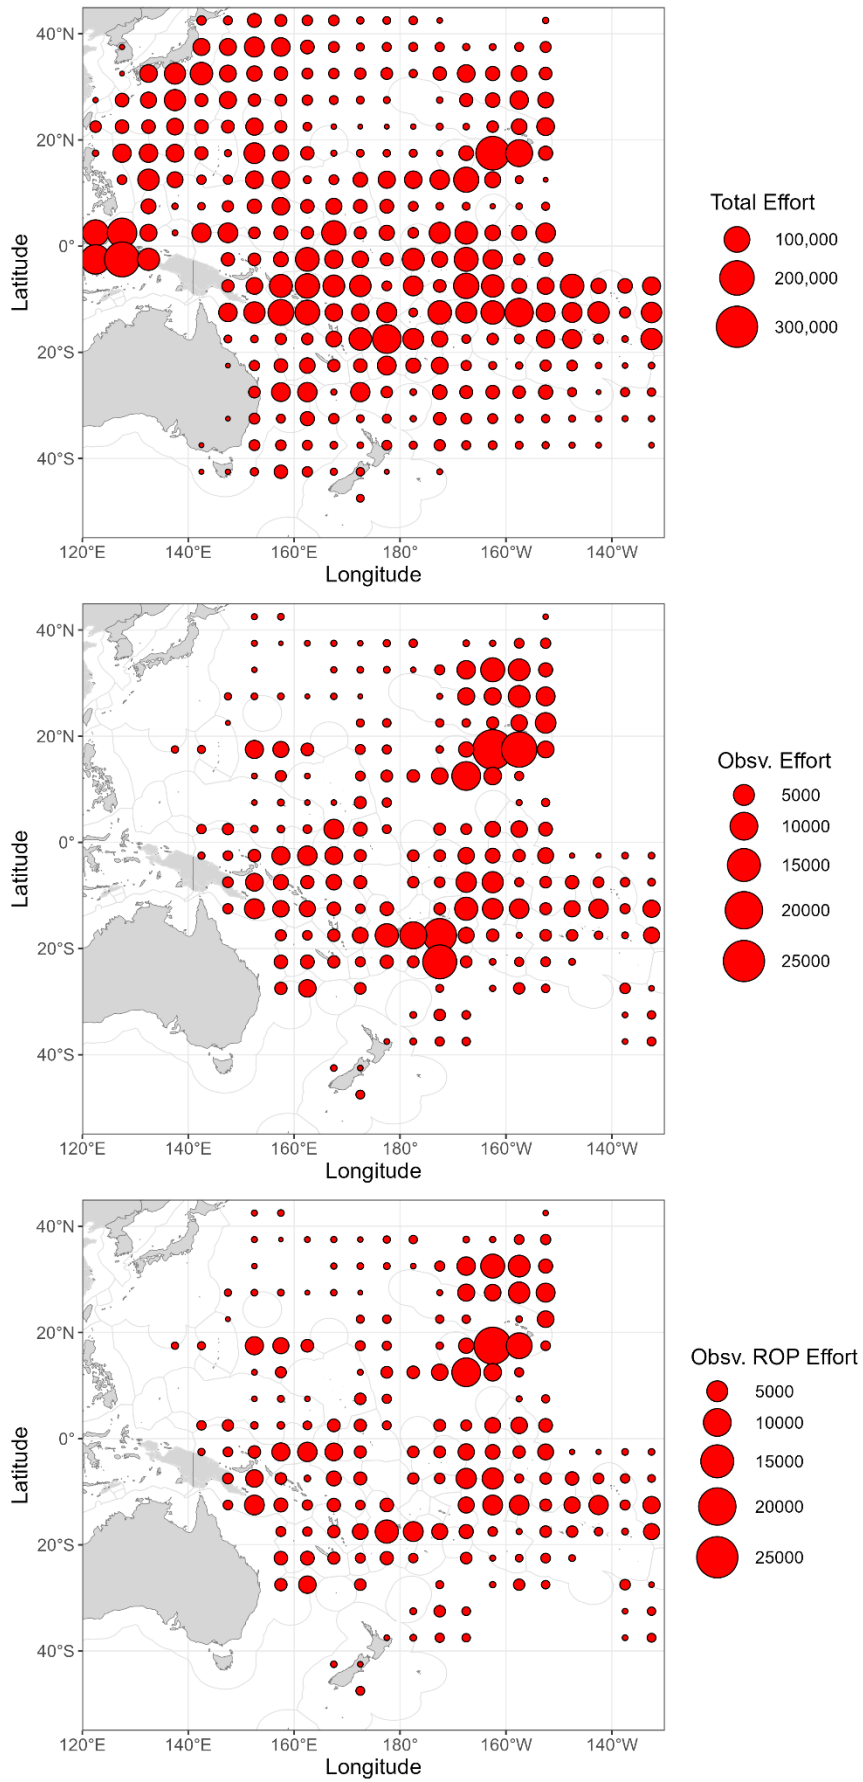

Figure 3. Distribution of longline effort (100 hooks; top), observer effort (100 hooks; middle) and observed ROP effort (100 hooks; bottom) in the WCPFC Area for 2023.

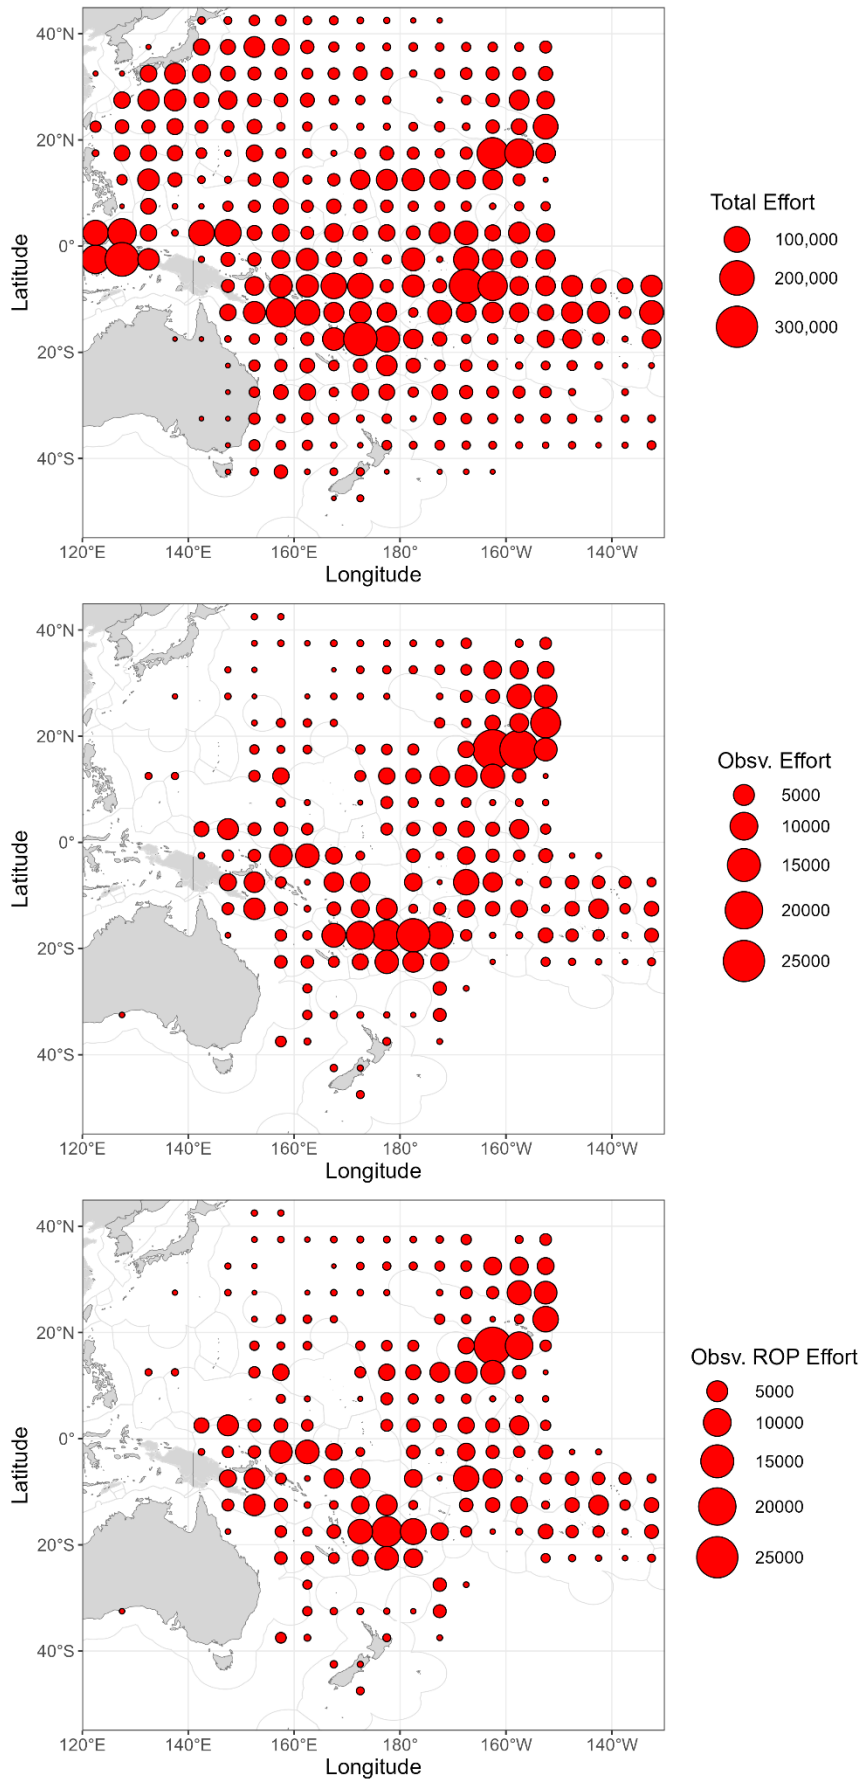

Figure 4. Distribution of longline effort (100 hooks; top), observer effort (100 hooks; middle) and observed ROP effort (100 hooks; bottom) in the WCPFC Area for 2022.

Figure 5. Cumulative monthly purse seine observer trips conducted in the WCPFC Area for 2017–2023 (based on data received and advice on observer placements).

NOTES

- CATEGORY 1** represents estimated trips determined from VMS data. These trips exclude the Philippines and Indonesian domestic fisheries and purse seine trips undertaken completely outside the tropical waters (20°N-20°S). In some instances, trips identified in the VMS data where no fishing actually took place (e.g. returning to home port in Asia for annual maintenance) may have been included in the “Estimated” trips and so the values in this column will be an over-estimate of actual fishing trips.
- CATEGORY 2** represents trips of unknown status and is essentially the difference between VMS trips (**CATEGORY 1**) and those trips that SPC has a record of having taken place (**CATEGORY 3**). This category may also include fishing trips without an observer on-board.
- CATEGORY 3** covers (i) data received at SPC and (ii) basic trip information provided by observer programmes indicating an observer trip took place, but data have yet to be provided.
- SPC employs a strategy of processing the most recent observer data as highest priority, mainly to ensure CCMs can satisfy their Part 1 and Part 2 reporting obligations (for which compliance applies to the most recent year). This is reflected in the “% of trips received without problems” in **CATEGORY 5** whereby the outstanding data entry for 2022/2021 has higher priority than outstanding trips data entry in 2016/2017, for example. Every effort has been made to resolve the backlog from previous years.
- CATEGORY 7** is essentially the difference between **CATEGORY 3** and **CATEGORY 4**.
- CATEGORY 8** represents the number of trips included in the WCPFC subset’s database.
- Observer data from the Philippines fleet fishing in the High Seas Pocket #1 are included in this table.

Table 3. Provisional 2022 Longline Regional Observer Programme (ROP) coverage by CCM – based on reporting from CCMs and data submissions
The fleet breakdown, metric and reporting by CCMs is based on WCPFC11 Summary Report para 483-486 and Attachment L (Anon., 2010a). Flag CCM reporting is from Annual Report Part 1.

			REGIONAL OBSERVER PROGRAMME (ROP) DATA COVERAGE						
			(minimum required for ROP is 5%)

NOTES

1. The fleet breakdown, metric and reporting by CCMs is based on WCPFC11 Summary Report para 483-486 and Attachment L (Anon., 2010a). Flag CCM reporting includes information from Annual Reports - Part 1.
2. Domestic fleet fishing within their EEZ. There is no fishing in other EEZs but there may be very infrequent activities in adjacent high seas area. The activities of this fleet are therefore not relevant to the requirements for ROP longline coverage.
3. China has advised in their Annual Report Part 1 that their choice of metric is “days-at-sea”. Total estimated effort (of days at sea) is determined from available operational logbook data, raised to account for incomplete coverage (of operational logbook data provided).
4. In a communication of 28 February 2015, EU advised that they will use “NUMBER OF TRIPS” for measuring and reporting observer coverage on its flagged LL vessels for years from 2014. For 2013, they had previously advised that “*We are currently exploring options for improving observer coverage on EU LLs. Recent amendments in the ES legislation should contribute also in improving these aspects. At TCC10, EU advised that legislation has been adopted.*”
5. No information provided by the CCM for this fleet.
6. The information provided for the US fleets EXCLUDES activities in their respective EEZs, that is, the coverage rates provided are for their ROP trips only and estimated effort is for activities outside their EEZ.
7. The information provided for these fleets EXCLUDES activities of the domestic component (i.e. vessels fishing exclusively in the home EEZ and adjacent high seas only); the coverage represents the component that conduct ROP-defined trips only.
8. Most (if not all) vessel trips (and therefore most days-at-sea) would be non-ROP trips since mostly restricted to waters of national jurisdiction. Observer coverage is for all activities (ROP and non-ROP) of the domestic fleet.
9. Observer trip value represents the trip data provided to SPC in the absence of advice from this CCM on total number of observer trips conducted. This value may not represent the overall trips undertaken (i.e. it may be an under-estimate).
10. All vessel trips (and therefore days-at-sea) would be defined as ROP trips. “Distant-water” vessels have very long trips and since some fleets tranship at sea, the unit of coverage might more suitably be “days-at-sea” for these situations.
11. Covers both ‘fleets’ as coverage cannot be split by fleet at this stage.
12. Tuvalu advised their choice of metric was “Number of Trips”.
13. Observer coverage information (as nominated from flag state) was taken from the CCMs WCPFC Annual Report Part 1 prepared for SC14 (as per WCPFC11 Summary Report paragraphs 483 – 486).
14. Includes observer trips conducted by Coastal state observer programmes on Chinese Taipei-flagged STLL vessels.
15. This CCM did not have flagged longline vessels on the Record of Fishing Vessels in 2022.
16. No longline vessels from Philippines active in 2022.
17. Australia commenced producing data from their E-Monitoring system from 2015. E-Monitoring data are not yet considered to count towards ROP coverage.
18. Japan provided trip-level details for 2022 observer activities including trip monitoring information. Some data submitted recently have yet to be loaded and may not be included in the total effort for submitted data.
19. Observer data provided does not satisfy all of the ROP minimum data field standards.
20. There is evidence that additional observer trips have been conducted by coastal states, but the data have yet to be provided.
21. The number of total trips for the Indonesian domestic longline fleet is not known but has been estimated based on the annual catch estimate and approximate catch per trip.
22. 2022 observer data provided for the China longline fleet included some activity in the Pacific Ocean beyond the WCPFC Area; these data have been excluded in the coverage rates of data submitted in this table.
23. Effort metric for Korean longline fleet in 2022 is DAYS AT SEA. Coverage of data submitted represents only activity in the WCPFC Area.
24. No activity in 2022 by this CCM’s longline fleet.
25. Represents the chartered vessels in this fleet; no vessels were flagged to RMI in 2022.
26. Excludes trips/activities from chartered vessels and also non-fishing trips.
27. The information provided for these fleets EXCLUDES activities of either domestically-based (in home EEZ) or locally-based components of this fleet; that is, vessels from this fleet that fish exclusively in one Pacific Island EEZ and adjacent high seas only are not included (i.e. considered non-ROP trips); the coverage represents the component that conduct ROP-defined trips only.

Table 4. Provisional 2023 Longline Regional Observer Programme (ROP) coverage by CCM – based on reporting from CCMs and data submissions

The fleet breakdown, metric and reporting by CCMs is based on WCPFC11 Summary Report para 483-486 and Attachment L (Anon., 2010a). Flag CCM reporting is from Annual Report Part 1.

NOTES

1. The fleet breakdown, metric and reporting by CCMs is based on WCPFC11 Summary Report para 483-486 and Attachment L (Anon., 2010a). Flag CCM reporting includes information from Annual Reports - Part 1.
2. Domestic fleet fishing within their EEZ. There is no fishing in other EEZs but there may be very infrequent activities in adjacent high seas area. The activities of this fleet are therefore not relevant to the requirements for ROP longline coverage.
3. China has advised in their Annual Report Part 1 that their choice of metric is “days-at-sea”. Total estimated effort (of days at sea) is determined from available operational logbook data, raised to account for incomplete coverage (of operational logbook data provided).
4. In a communication of 28 February 2015, EU advised that they will use “NUMBER OF TRIPS” for measuring and reporting observer coverage on its flagged LL vessels for years from 2014. For 2013, they had previously advised that “*We are currently exploring options for improving observer coverage on EU LLs. Recent amendments in the ES legislation should contribute also in improving these aspects. At TCC10, EU advised that legislation has been adopted.*”
5. No information provided by the CCM for this fleet.
6. The information provided for the US fleets EXCLUDES activities in their respective EEZs, that is, the coverage rates provided are for their ROP trips only and estimated effort is for activities outside their EEZ.
7. The information provided for these fleets EXCLUDES activities of the domestic component (i.e. vessels fishing exclusively in the home EEZ and adjacent high seas only); the coverage represents the component that conduct ROP-defined trips only.
8. Most (if not all) vessel trips (and therefore most days-at-sea) would be non-ROP trips since mostly restricted to waters of national jurisdiction. Observer coverage is for all activities (ROP and non-ROP) of the domestic fleet.
9. Observer trip value represents the trip data provided to SPC in the absence of advice from this CCM on total number of observer trips conducted. This value may not represent the overall trips undertaken (i.e. it may be an under-estimate).
10. All vessel trips (and therefore days-at-sea) would be defined as ROP trips. “Distant-water” vessels have very long trips and since some fleets tranship at sea, the unit of coverage might more suitably be “days-at-sea” for these situations.
11. Covers both ‘fleets’ as coverage cannot be split by fleet at this stage.
12. Tuvalu advised their choice of metric was “Number of Trips”.
13. Observer coverage information (as nominated from flag state) was taken from the CCMs WCPFC Annual Report Part 1 prepared for SC14 (as per WCPFC11 Summary Report paragraphs 483 – 486).
14. Includes observer trips conducted by Coastal state observer programmes on Chinese Taipei-flagged STLL vessels.
15. This CCM did not have flagged longline vessels on the Record of Fishing Vessels in 2023.
16. No longline vessels from Philippines active in 2023.
17. Australia commenced producing data from their E-Monitoring system from 2015. E-Monitoring data are not yet considered to count towards ROP coverage.
18. Japan provided trip-level details for 2023 observer activities including trip monitoring information. Some data submitted recently have yet to be loaded and may not be included in the total effort for submitted data.
19. Observer data provided does not satisfy all of the ROP minimum data field standards.
20. There is evidence that additional observer trips have been conducted by coastal states, but the data have yet to be provided.
21. The number of total trips for the Indonesian domestic longline fleet is not known but has been estimated based on the annual catch estimate and approximate catch per trip.
22. 2023 observer data provided for the China longline fleet included some activity in the Pacific Ocean beyond the WCPFC Area; these data have been excluded in the coverage rates of data submitted in this table.
23. Effort metric for Korean longline fleet in 2023 is DAYS AT SEA. Coverage of data submitted represents only activity in the WCPFC Area.
24. No activity in 2023 by this CCM’s longline fleet.
25. Represents the chartered vessels in this fleet; no vessels were flagged to RMI in 2023.
26. Excludes trips/activities from chartered vessels and also non-fishing trips.
27. The information provided for these fleets EXCLUDES activities of either domestically-based (in home EEZ) or locally-based components of this fleet; that is, vessels from this fleet that fish exclusively in one Pacific Island EEZ and adjacent high seas only are not included (i.e. considered non-ROP trips); the coverage represents the component that conduct ROP-defined trips only.

Table 5. Coverage of Longline Observer data in the WCPFC Area, for 2022 (all observer data available to the WCPFC Science Service Provider; includes both ROP and non-ROP data).

NOTES

1. Cov% represents coverage in the tropical WCPFC purse seine fishery using total target tuna catch estimate as the metric.
2. Cov% represents coverage in the WCPFC longline fishery using total target tuna catch estimate as the metric.
3. Trips represent observer trips conducted by the observer programme. This metric is not used in the estimate of coverage (see notes 1. and 2. above).
4. Represents data received at SPC, including some data not yet to be processed.

Table 8. Annual longline E-Monitoring (EM) data reviews (sets), by national EM programme, 2015–2023.

	E-MONITORING DATA (Sets reviewed)								
	2015	2016	2017	2018	2019	2020	2021	2022	2023
