

South Pacific albacore iTRP progress (WCPFC21-2024-29)

COMMISSION
Twenty First Regular Session
Suva, Fiji

SPC-OFP
28 November – 3 December 2024

SPA iTRP recalibration

- SPA iTRP defined by WCPFC20 as $0.96 \times SB_{2017-2019} / SB_{F=0}$
 - Value of iTRP updated with new assessment
 - Result: iTRP = 50% $SB_{F=0}$

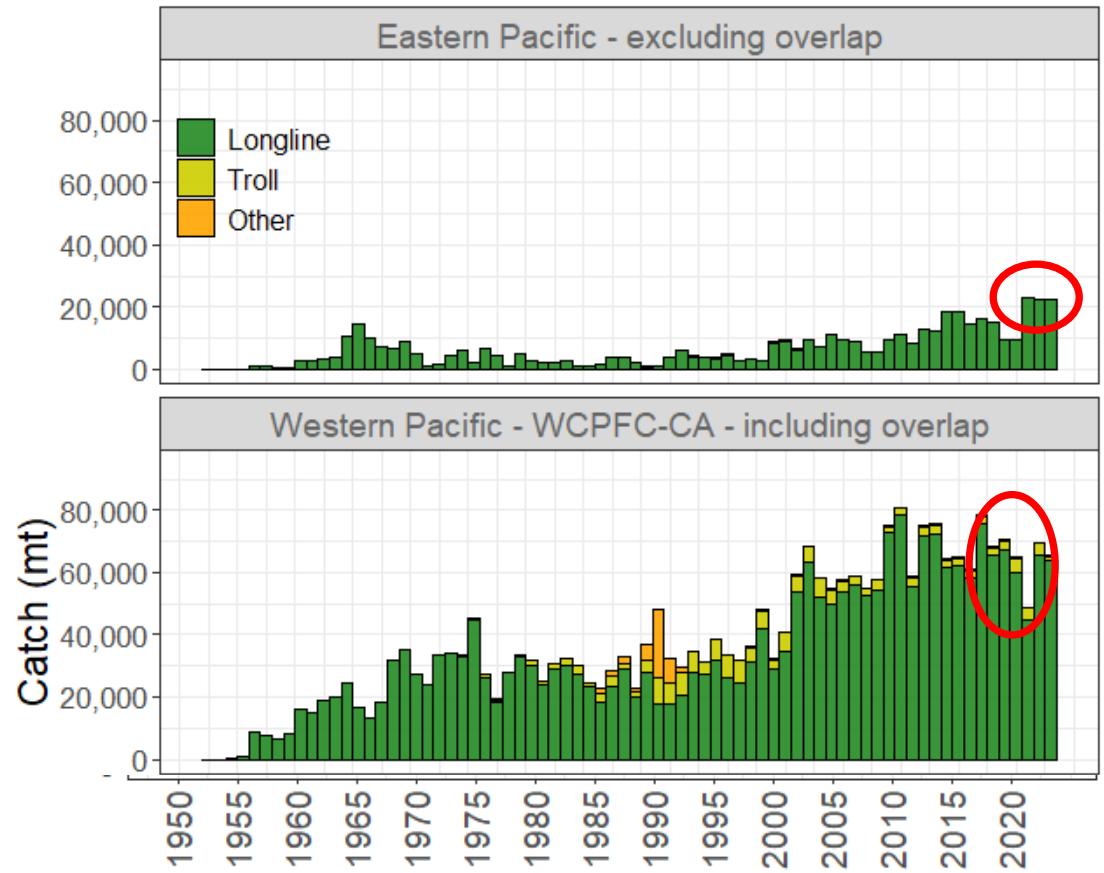

SPA iTRP – alternative depletions

- Used stochastic projections and look at long term implications
- Catch based projections – based on weight of fish OR numbers (SC20)
 - Catch in weight more pessimistic
- Adjust future catch to achieve depletions in the long term
- When considering higher future catches (to achieve more depleted stock status), some projections ‘failed’ (insufficient fish to allow the projected catch to be taken)
 - These runs set to zero for the estimation of depletion and risk

SPA iTRP baseline catches

- Baseline 2020-2022 catch levels in the WCPFC-CA.
 - Remainder of EPO 'set' at 22,500 mt

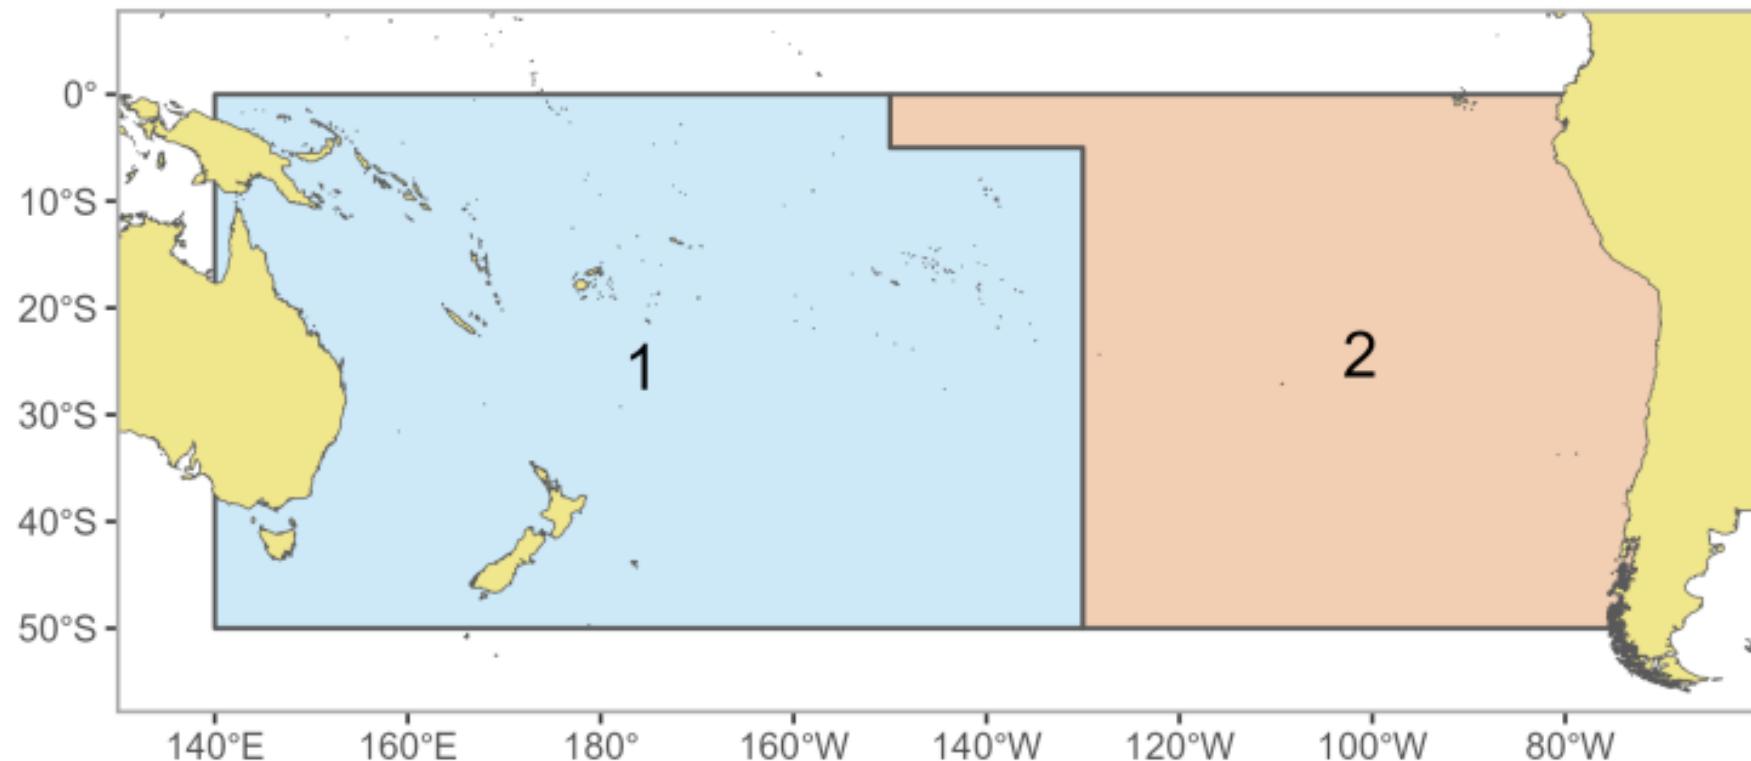

22,500 mt

~60,700 mt (LL + TR)

SPA iTRP 'fishery control' scenarios

- Two scenarios
 - Adjust WCPFC-CA LL & TR fisheries up and down, constant catch in remainder EPO
 - Adjust across the whole of the South Pacific (where EPO adjusted from 22.5k)

2024 SPA stock assessment

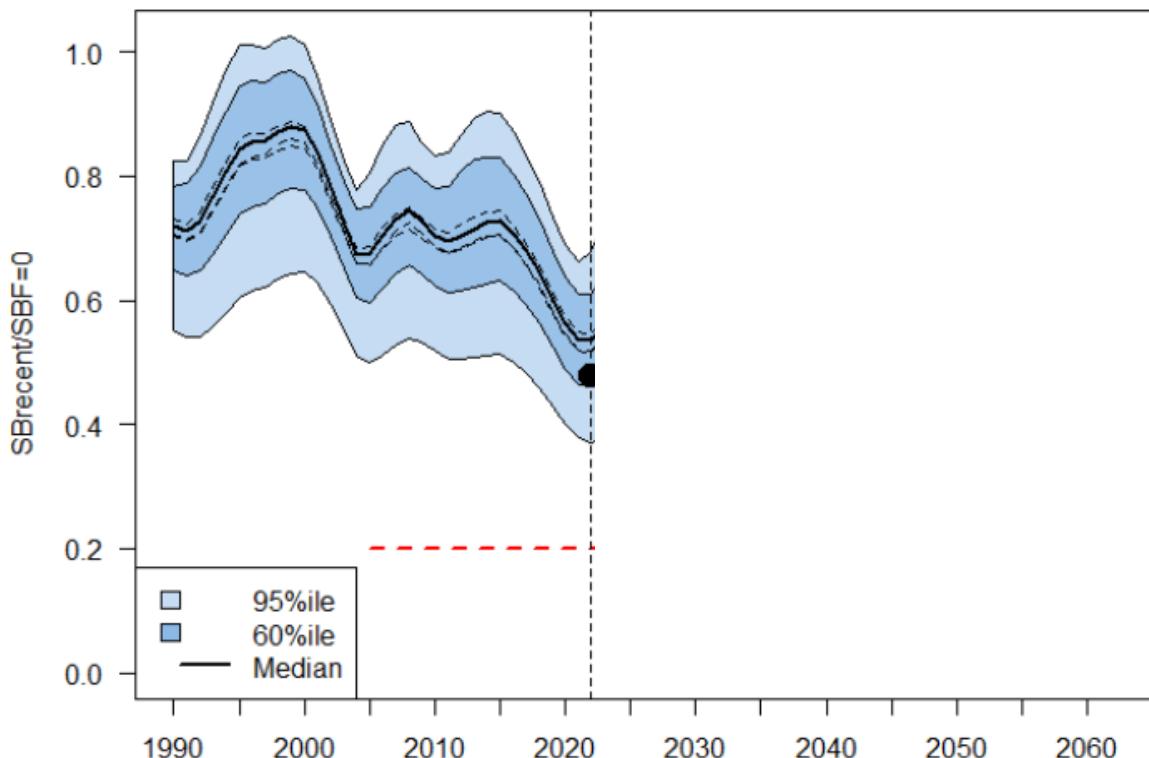

Figure 62: South Pacific albacore SB depletion for the WCPFC Convention Area from the uncertainty grid of assessment model runs for the period 1990 to 2022 (the vertical line at 2022 represents the last year of the assessment), and stochastic projection results for the period 2023 to 2062 assuming actual catch and effort levels in 2022, and that 2022 fishing levels continued. Prior to 2022 the data represent the 60th and 95th percentiles of the uncertainty grid from the assessment models and the median. During the projection period (2023-2062) levels of recruitment variability estimated over the period used to estimate the stock-recruitment relationship (1972-2020) are assumed to continue in the future. The dashed lines indicate three example trajectories (chosen randomly out of 5000) from the model grid. The red dashed line represents the WCPFC agreed limit reference point (0.20). Point represents $SB_{\text{recent}}/SB_{F=0}$, as defined within the stock assessment process.

2024 SPA stock assessment

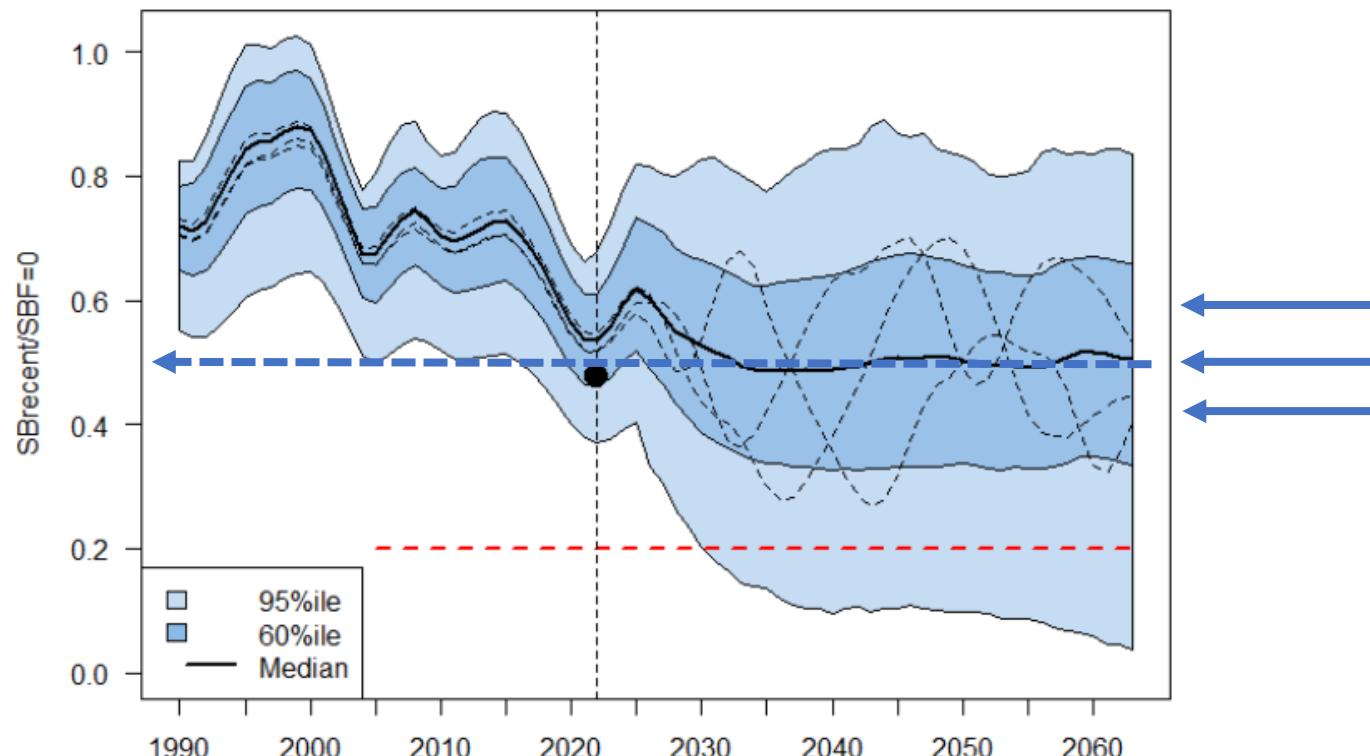

Figure 62: South Pacific albacore SB depletion for the WCPFC Convention Area from the uncertainty grid of assessment model runs for the period 1990 to 2022 (the vertical line at 2022 represents the last year of the assessment), and stochastic projection results for the period 2023 to 2062 assuming actual catch and effort levels in 2022, and that 2022 fishing levels continued. Table 7

Summary

- Recalibrated iTRP = 50% SB_{F=0}
- Trade off:
 - greater depleted stock ~ higher relative catch, lower catch rates and greater LRP risk
 - Less depleted stock > relatively lower catches, higher catch rates and lower LRP risk
- Impact on CPUE declines greater on PICT fleets as stock becomes more depleted
- Catch weight assumption is more ‘pessimistic’ – but matches mgmt. basis
- Level of fishing in the EPO does affect catch level needed to achieve WCPFC-CA TRP

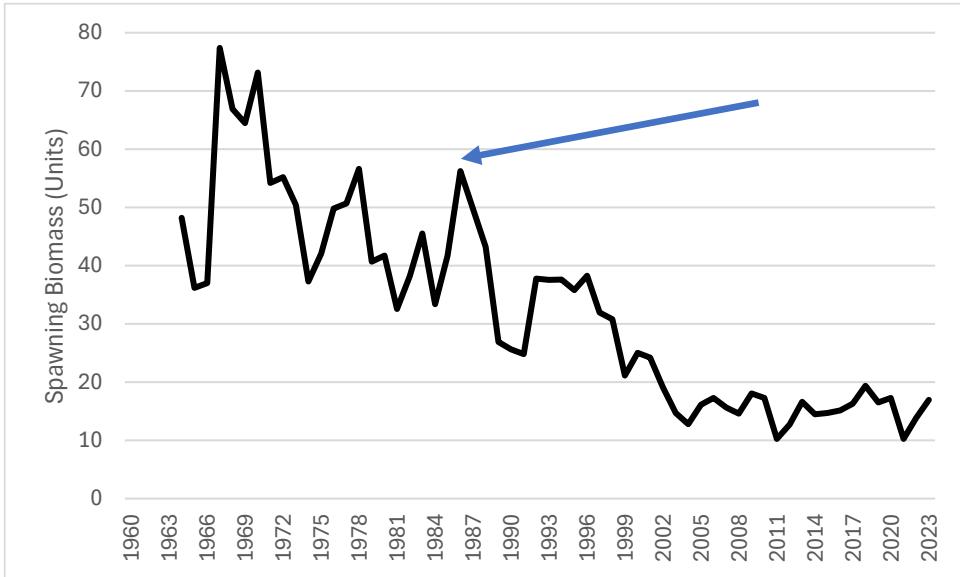

- Invited to:
 - consider the results presented here when adopting the confirmed or amended iTRP within a Conservation and Management Measure that specifies a management procedure for South Pacific albacore tuna.

SPA iTRP – numbers v weight (T2 v T1)

- WCPFC-CA only adjustment to catch (numbers/**weight**) (EPO fixed)
