ESTIMATES OF ANNUAL CATCHES IN THE WCPFC STATISTICAL AREA

Oceanic Fisheries Programme
Secretariat of the Pacific Community
Noumea, New Caledonia

July 2006

INTRODUCTION

Estimates of annual catches in the WCPFC Statistical Area (Figure 1) are presented for target tuna species, i.e., albacore (*Thunnus alalunga*) bigeye (*Thunnus obesus*), skipjack (*Katsuwonus pelamis*) and yellowfin (*Thunnus albacares*), and major billfish species, i.e., black marlin (*Makaira indica*), blue marlin (*Makaira mazara*), striped marlin (*Tetrapturus audax*) and swordfish (*Xiphias gladius*). Estimates of catches in recent years of other non-target fish species, determined from observer data, are also presented. Estimates of catches of southern bluefin tuna (*Thunnus maccoyii*), which are compiled by the Commission for the Conservation of Southern Bluefin Tuna (CCSBT), and catches of small tunas in the domestic fisheries of Indonesia and the Philippines are not presented. Recent catches of tuna in the domestic fisheries of Vietnam may have amounted to about 19,000 tonnes of skipjack, 18,000 tonnes of yellowfin and 5,500 tonnes of bigeye, for a total of 42,500 tonnes (Lewis 2005); however, these catches have been ignored in the tables and figures presented below.

TARGET TUNA SPECIES

Tables 1 and 2 and Figures 2 and 3 present estimates of annual catches of target tunas in the WCPFC Statistical Area.

Tables 3–6 present estimates of annual catches of target tunas in the WCPO Area and the EPO Area (Figure 1) by gear type. Tables 7–9 present estimates of annual catches of target tunas for the WCPO, the EPO and the Pacific Ocean by species.

Table 10 and 11, and Figures 4 and 5, present global catches of target tunas, by species and ocean area respectively.

MAJOR BILLFISH SPECIES

Table 12 presents estimates of commercial catches of the four major billfish species by gear type. Table 13 and Figure 6 present estimates of the major billfish catches for all gear types combined.

OTHER NON-TARGET SPECIES AND SPECIES GROUPS

Estimates of other non-target species and species groups for the longline and purse-seine fisheries in the WCPFC Statistical Area, excluding the domestic fisheries of Australia, Indonesia, the Philippines and Chinese Taipei, were determined from observer data held by the SPC Oceanic Fisheries Programme. Tables 14 presents observer coverage. No observer data are available for the domestic fisheries of Indonesia, the Philippines and Chinese Taipei; observer data covering the domestic longline fleet of Australia have not yet been imported into the OFP observer database.

For longline, observer coverage from 1993 to 2004 has been 0.65% of total effort. Coverage of the distant-water longline fleets by data held by the OFP is less than 0.1%.

For purse-seine, observer coverage from 1995 to 2004 has been 3.59%. Coverage rates have increased from 2002 onwards due to higher coverage of the fleets of the FSM Arrangement, including Federated States of Micronesia, Marshall Islands, Papua New Guinea, Solomon Islands and Vanuatu. Coverage rates for sets on unassociated and associated schools has been similar.

Catches for each species or species group were estimated using model-based predictors of the catch rate. For longline, the relationship between the natural logarithm of the catch rate (kilograms per 100 hooks) per trip and year, month, latitude, longitude and the number of hooks between floats (a proxy for depth) were examined with general additive models (GAM), using tensor splines. Variables that appeared not to be related were excluded from the predictive model, which was selected by varying the degrees of freedom for each remaining variable in a linear model of polynomial splines and comparing the Bayesian information criterion (BIC). The selected model was then applied to effort data raised to represent total fishing effort and stratified by sector (see Table 14), year, month, latitude, longitude and the number of hooks between floats. The 2.5%, 50% and 97.5% quantiles of catches estimated by taking 1,000 random samples from the posterior distributions of the model coefficients were used to derive a point estimate of the catch and a confidence interval. For purse seine, a similar procedure was followed, with the data stratified by school association (i.e., unassociated or associated), year, month, latitude and longitude.

Catch estimates for longline and purse-seine are presented in Tables 15 and 16 respectively. Figures 7 and 8 present catch estimates and confidence intervals for non-target species caught by longline and purse seine respectively.

The confidence intervals shown in Figures 7 and 8 are based entirely on sampling error and do not include other sources of uncertainty, such as measurement errors in the observer data (e.g., the misidentification of species by the observer), errors in the estimates of total effort, and, most importantly, model uncertainty. In regard to the latter, a number of simplifying assumptions have been made to allow estimates of catch rates to be made in strata where there are no observer data. For example, interaction effects, such as between latitude and longitude or between year and the other variables, have been ignored. While interaction effects are almost certainly important, incorporating them in the models would not have allowed the reliable interpolation of strata for which observer data are missing. For these reasons, the confidence intervals shown in Figures 7 and 8 underestimate the true uncertainty.

Figure 9 and 10 presents the species group composition in the WCPFC Statistical Area (excluding the domestic fisheries of Indonesia, the Philippines and Chinese Taipei) during 1995–2004 for longliners, and longliners and purse seiners combined, respectively. The catch of sharks and rays and other non-target species accounted for 35% and 1.8% of the total catch by longliners and purse seiners respectively.

ACKNOWLEDGEMENT

Dr Brian McArdle of the Department of Statistics, University of Auckland, developed the methodology for the estimation of catches of other non-target species and species groups.
