## Introduction

This appendix contains summaries of information used in the paper WCPFC-EBSWG-WP3, and sets out the detail of species information for 70 species included in the study of Ecological Risk Assessment (ERA) for seabirds in WCPFC fisheries. Four species were excluded as it was found that their distributions did not overlap the WCPFC zones (see Results for further details).

Table 1 in the document sets out the order in which the species occur in the document. They are listed in alphabetical order of their scientific name.

The appendix contains a series of species-level summary tables with of information about the species in the study, described in a table and figures for each species.

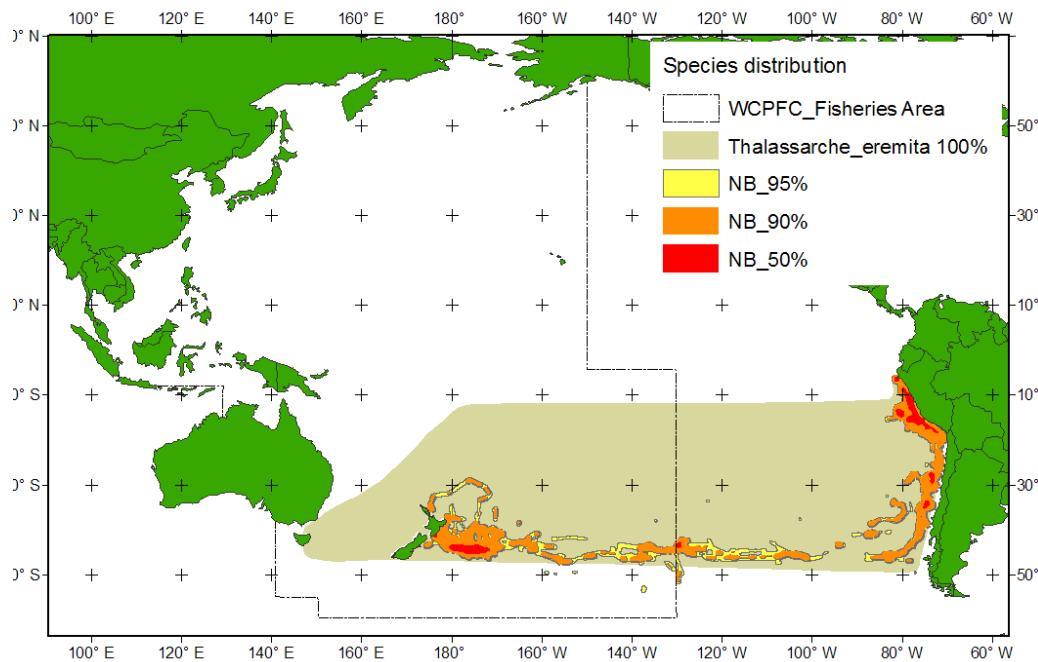

**Table A: Information about the species.** This includes the scientific and common names and codes used in the study and IUCN threat rankings.

**Table A: An example of Table A for Bulwer's petrel is shown below giving summary species level information**

BLI Scientific name	BLI Common name	Code for this study	IUCN Threat status	Estimated population size (individuals)
Bulweria bulwerii	Bulwer's Petrel	BUB	LC	

**Figure A- Species distribution maps.** These contain information from all the data sources used in the study. Each species presented here has a primary distribution map, derived from the BirdLife International World Bird Database – the species Range Map (shown in beige). This area is assumed to contain 100% of the species within its annual cycle. Other layers of information present for some species are i) distribution of individuals from different breeding colonies based on average foraging radii for the species – these are indicated by circles on the map labeled with the island name where the colony was found. ii) Remote tracking studies on a subset of species are represented by Utility Distributions (UDs). Studies with these layers of information are divided into Breeding (BR) and/or Non-Breeding (NB) ranges, and split into 1 to 3 layers, typically 50% UD, 90% UD, 95% UD. These are represented on separate maps, with blue tints for Breeding UDs, and Red-Yellow colours for Non-Breeding UDs. The sample sizes for each tracking study are set out in Table 1 (numbers of tracks of individuals tracked).

**Figure A: An example of the distribution information used in the ERA study for Chatham Albatross is shown below, showing the Non-breeding range (Coloured density contours at 50%, 90% and 95% Utility Distributions), and the Range Map (Beige – 100% species range).**

## Data Gaps

The information contained in this appendix is the available information on seabird species (albatrosses and petrels) included in the Ecological Risk Assessment work undertaken for WCPFC in 2009. Further data exist, but were not available at the time of the study, such as further tracking study outputs, and species colony location data. Over time, this information will be able to be used to refine our knowledge of species distributions. Therefore, this work should be seen as an evolving project, which will be continuously improved, but will approximate our collective knowledge of seabirds through time.

## Acknowledgements:

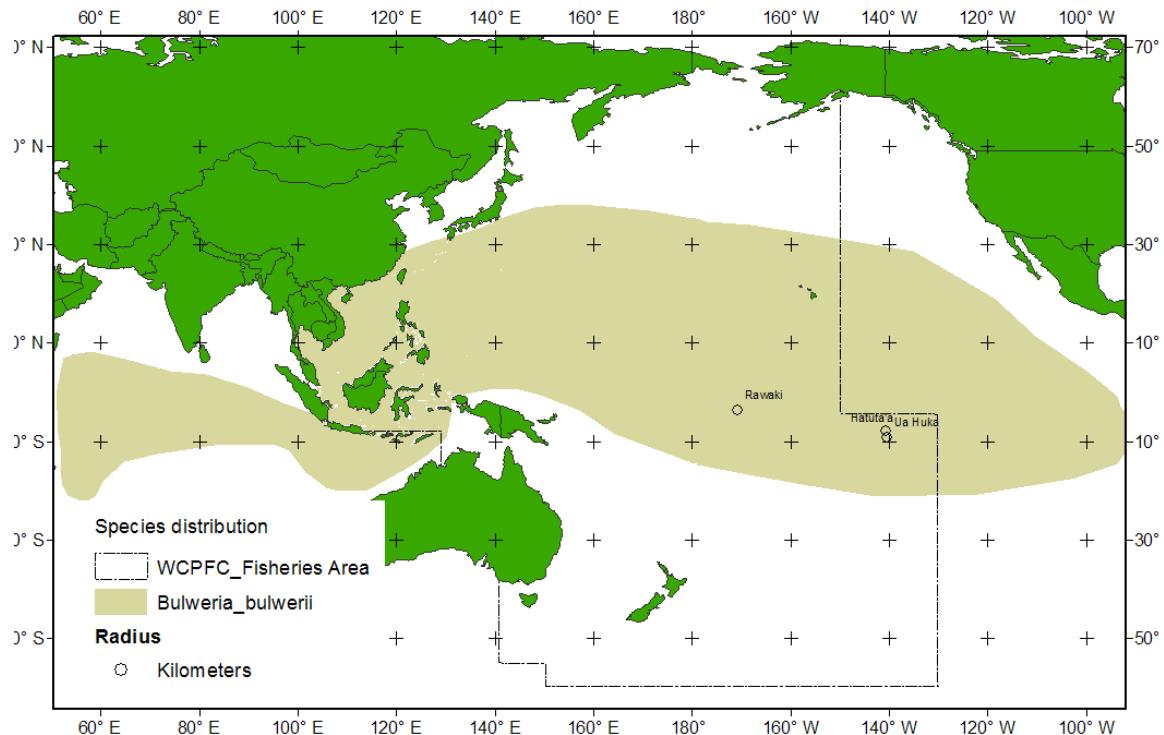

We wish to thank all the data contributors who have assisted with the development of this study, in particular the data holders for the BirdLife Global Procellariiform Tracking Database (listed on the cover sheet to this appendix). Further, we thank staff at BirdLife International who assisted in preparing species range maps, colony locations and other details, the species foraging ranges, and reviewers of this document.

Table 1. Order of listing of species in the document, sorted by the species code for this study.
