Review of available information on non-key shark species including mobulids and fisheries interactions

WCPFC-SC12-2016/ EB-WP-08

Laura Tremblay-Boyer and Stephen Brouwer
Oceanic Fisheries Programme, Pacific Community

Context

- 2015 Shark Research Plan mandated a review of the available data for non-key sharks (elasmobranchs)
- SC 11 ‘requests that SPC be tasked with reviewing available information on mobulid species (mantas and devil rays) and their interactions with fisheries managed by the WCPFC and prepare a paper for SC12 for consideration of these species for designation as WCPFC key sharks.’
 - Designation tables included in **Appendix II**, based on process outlined in WCPFC Key Document SC-08
 - Accessible online: <https://www.wcpfc.int/system/files/Key-Doc-SC-08-Process-Designation-Key-WCPFC-Shark-Species.pdf>
 - “Proposed key shark species should be chondrichthyan (shark, skate, ray or chimaera) and taxa whose documented range includes habitats within the WCPF Convention Area.” (WCPFC-SC-08)

Key sharks make up about 85-90% of the elasmobranch catch

Review of the available data for non-key sharks

- Using data from SPC observer data holdings, 1995 to 2015
- Temporal/spatial trends standardized for observer coverage
- Summary of taxonomic level of reporting
- **Appendix I:**
 - Catch rates by target species
 - Distribution maps*
 - CPUE*
- Status of measured variables: fate, condition and length

Longline: taxonomic resolution of observations

Purse seine: taxonomic resolution of observations

Longline: main groups observed

Purse seine: main groups observed

Longline: reported fate over time

Longline: reported condition at capture

Condition when first observed

Longline: reported condition at discard

Condition when discarded

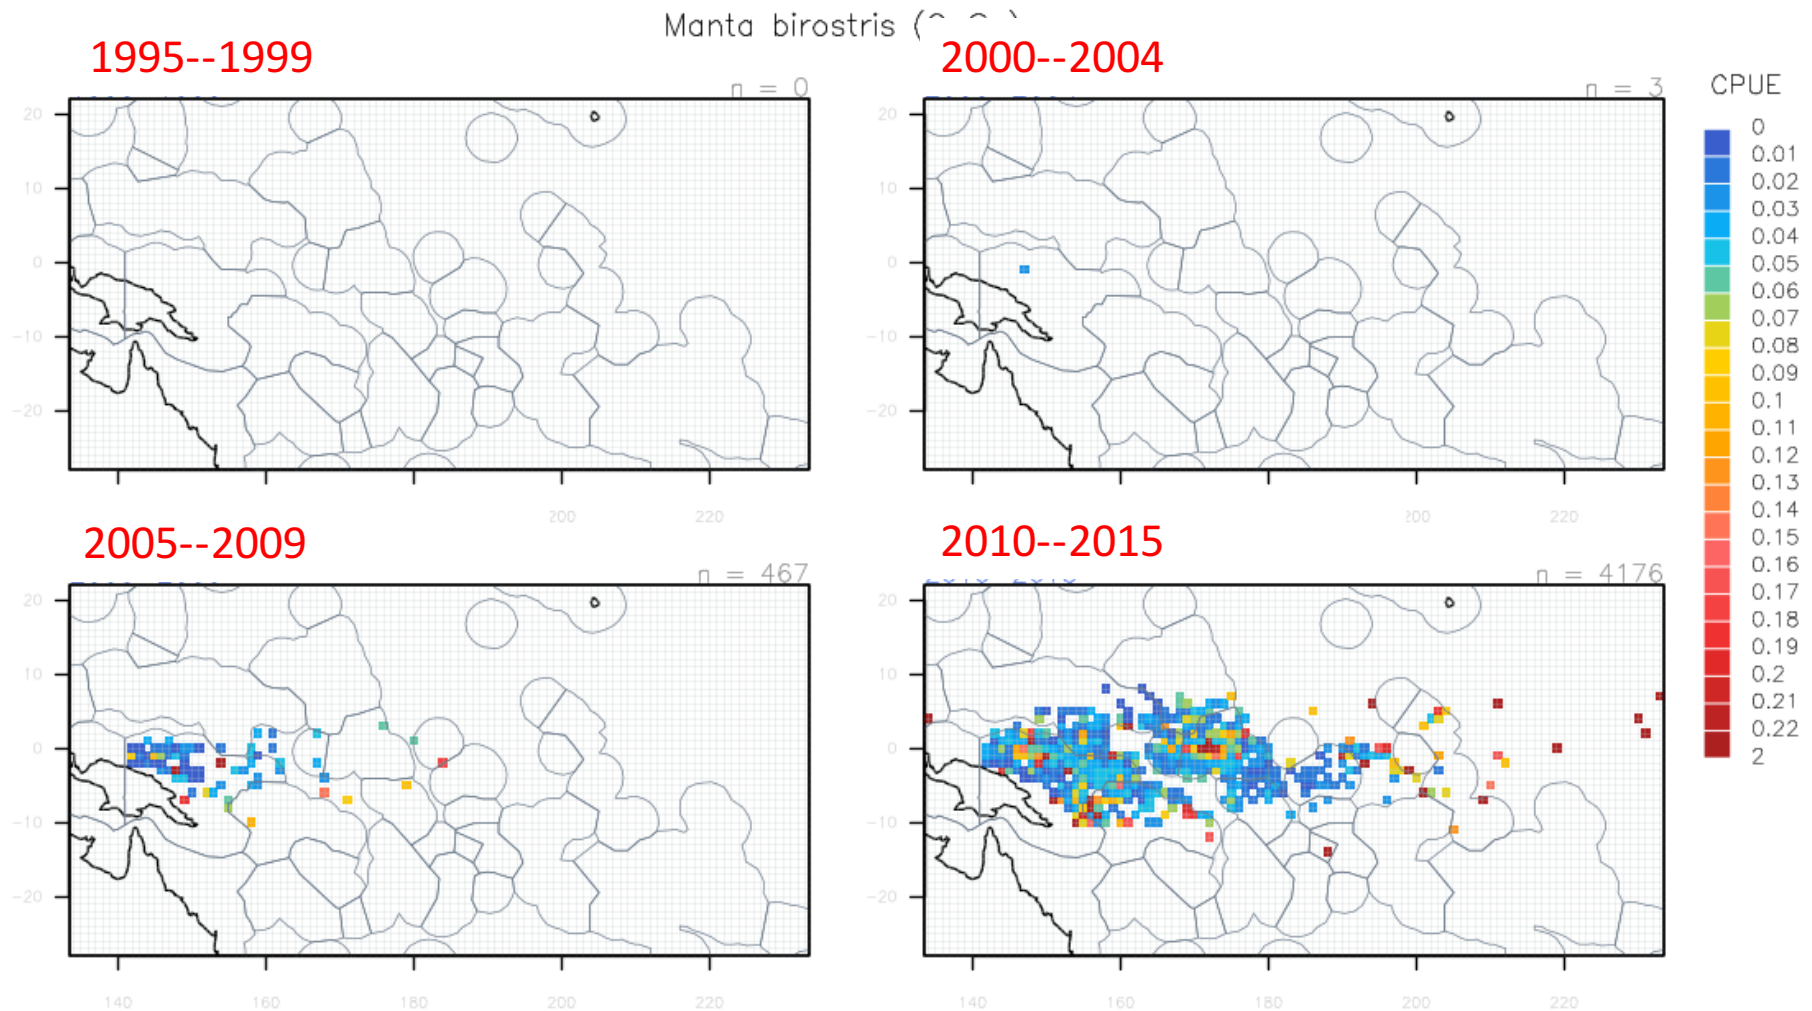

Longline: type of length measurement for rays

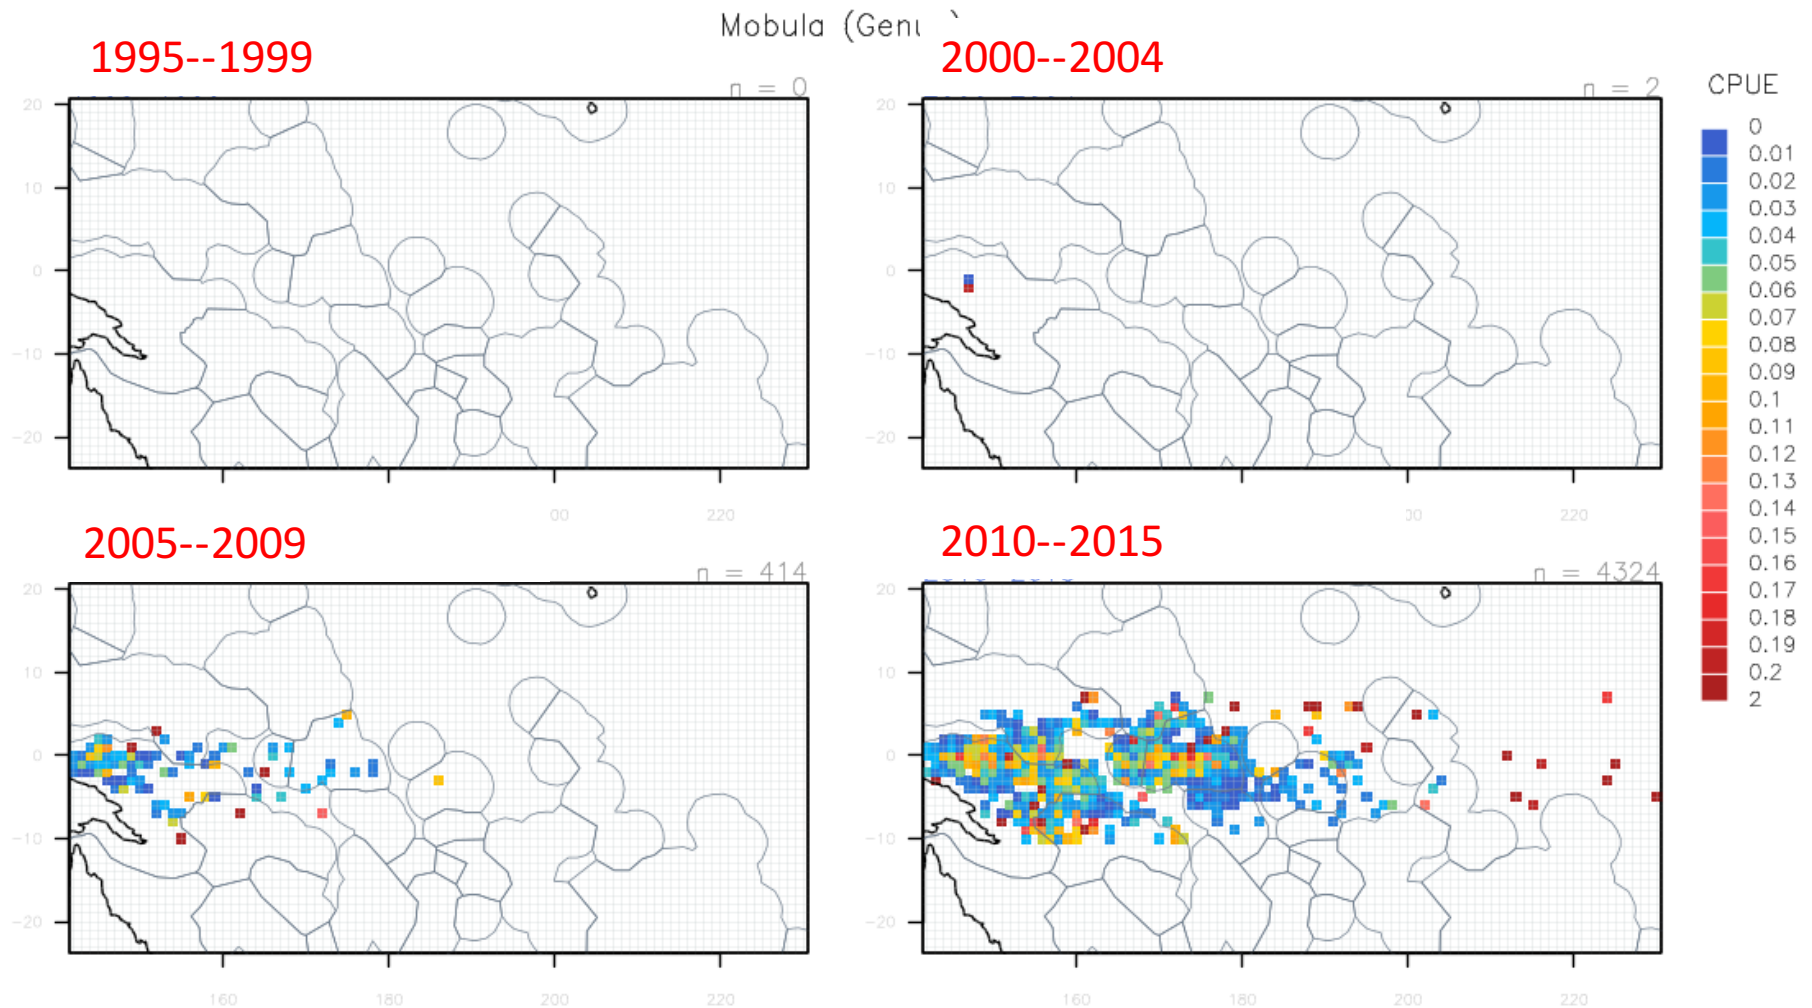

Focus on rays

- *Manta birostris*
 - *Mobula sp.*
 - *Pteroplatrygon violacea*
-
- Observed spatial distribution of catches in 5 years intervals
 - CPUEs by fleet/targeting species

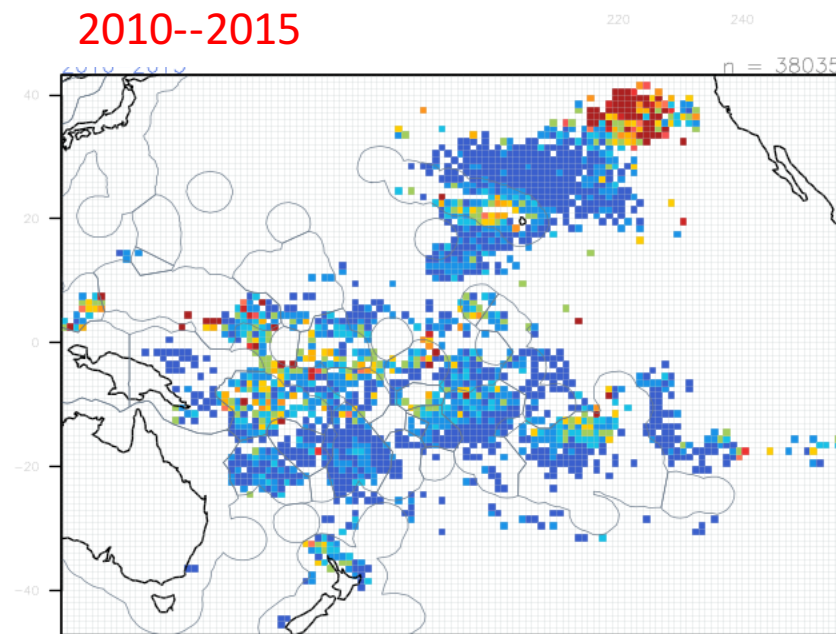

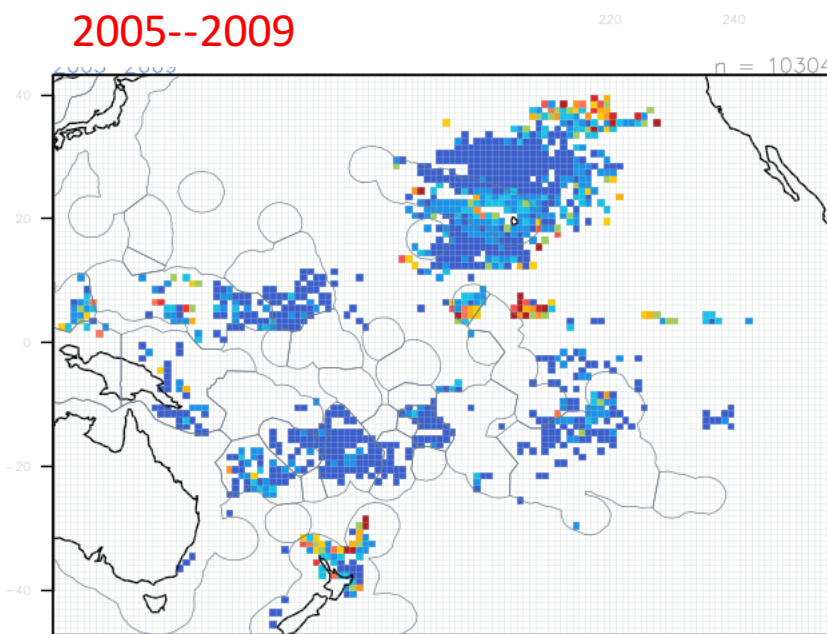

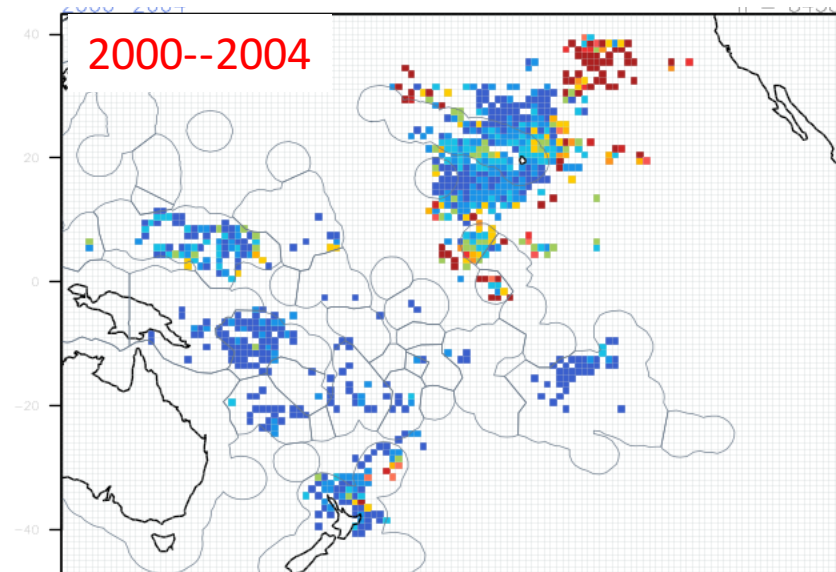

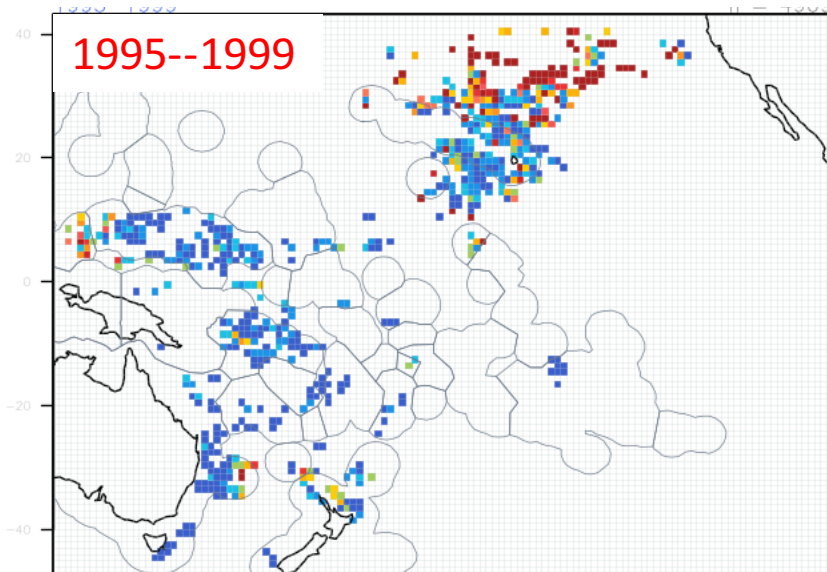

Purse seine: observed catch rates for *M. birostris*

Purse seine: observed catch rates for *Mobula sp.*

Longline: observed catch rates for *P. violacea*

Key shark designation tables

- For *Manta*, *Mobula* sp. and *P. violacea** we compiled tables of the assessment criteria to designate each as a key shark species in the Western and Central Pacific Ocean.
- Reporting requirements for species designated as key sharks:
 - recording catch in logbooks
 - fate information (e.g. retained or discarded)
- Given the current management regime, perceived stock status, ease of identification and wide distribution through the WCPO, **listing *Manta birostris* & *P. violacea* as a key shark species could enhance their management by the WCPFC.**
- Enhanced reporting is unlikely to lead to better species-specific information for *Mobula* sp. in the short-term. We suggest not listing them but rather **increase observer training to identify them.**

* Included due to frequency in catch, not as a request

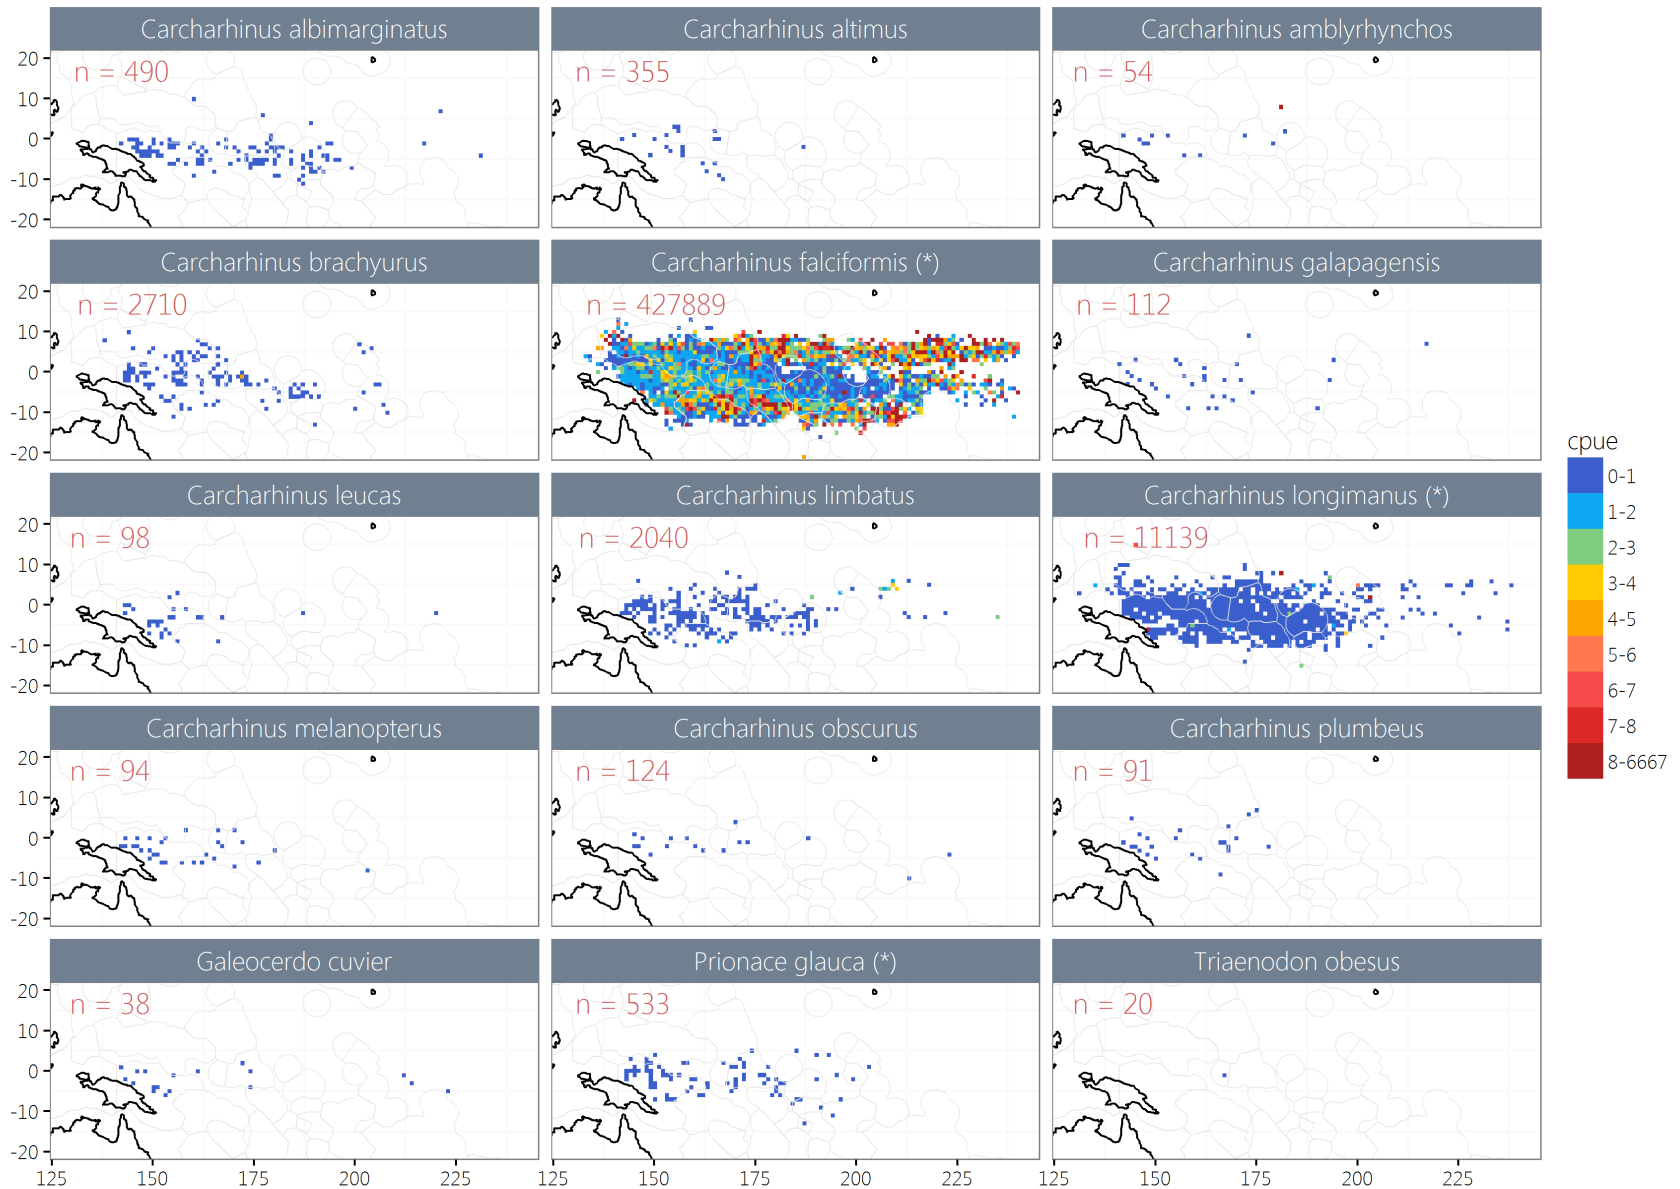

Recommendations

- A review of conversion factors to assess what length-length and length-weight conversion factors exist, to add existing conversion factors to the SPC database
- Purse seine observer training programmes add emphasis to *Mobula* identification as part of their curricula

General recommendations for enhancing the key shark designation table:

- In future key shark species designation assessments tables include "Is the management of _____ likely to be enhanced by having it listed as a WCPFC key shark species?"
- In future key shark species designation assessments include "SCxx recommends that WCPFCyy *list/does not list* _____ as a key shark species".

Purse seine observed CPUE (# ind/sets)

Pteroplatytrygon violacea (n=61573)

Annual trends for sets with positive catch

Seasonal trends for sets with positive catch

% observed sets

CPUE (indiv/1000 hooks)

#mm = 12
